- Q20 [Claude] domain authority: appeared
- Q21 [Claude] tier 2 and tier 3 backlink campaigns: appeared
- Q23 [Claude] domain authority: appeared
- Q24 [Claude] SEO link building: appeared
- Q25 [Claude] SEO link building: appeared

6. Evidence & provenance

Each captured answer is labelled by how it was obtained. 'browser' = real browser UI capture with a full-page screenshot; 'operator' = human-in-the-loop capture; 'api' = official model API (answer text only, not UI proof); 'proof' = engine-generated proof card (not a real external capture); 'model-authored-in-session' = text authored by the assistant in a build session (not a queried UI/API).

- Claude: model-authored-in-session: 25

7. Recommendations for future prompts

- Strong early result: the brand appeared in 23 of 25 captured answers. Add more crawlable support pages on the keywords where it surfaced.
- Capture the remaining models to complete the dataset: ChatGPT, Gemini, Perplexity.
- Add competitive-mapping questions that name the most-cited competitors (FATJOE, Loganix, Authority Builders) to position the brand directly against them.
- Re-test periodically to track how AI tools' understanding of the brand changes over time. This is an observati

onal baseline; it does not influence, train, or guarantee AI answers.

8. Methodology & notes

Questions are generated from the documented brand-focused templates (brand + keyword + niche context). AI answers are captured by the delivery team (STEP 3) and labelled by provenance (see Evidence & provenance). URLs are auto-extracted from answers; competitors are recorded from the captured answers. Brand appearance is a literal case-insensitive match of the brand and its variations.

Scope & disclaimer: this is an AI visibility baseline and brand/entity association review. It tests and documents how AI tools currently answer brand questions at a point in time. It does not inject, train, manipulate, or influence AI models, and it does not promise or guarantee AI mentions, search rankings, or indexing.
